LAYING SOLUTIONS

Outdoor Porcelain 20mm Tiles Are An Innovative Solution That Is Very Versatile Due To The Numerous Laying Possibilities They Offer: Dry Installation On Grass, Gravel, Or Sand, Screed With Adhesive, And Elevated Floor Installation.

DRY INSTALLATION ON GRASS

A

Easy to lay, adjust, and move. An ideal solution for public parks and private gardens

INSTALLATION ON SCREED WITH ADHESIVE

C

Build resilient and durable outdoor spaces, pathways, driveways, and more with the installation of 20mm tiles on screed with adhesive.

DRY INSTALLATION ON GRAVEL / SAND

B

Easy to lay, adjust, and move. Boasts ideal aesthetic features to enhance contemporary buildings.

ELEVATED FLOOR INSTALLATION

D

Easily removable, inspectible, and reusable. Ideal to be applied with different kinds of support and is apt for concealing wiring pipes, and more with accessibility.

CAUTION

- When carrying out an elevated floor installation it is recommended to check the intended use and to follow the installation instructions.
- It is recommended that the designer/client always check the suitability of the installation system selected according to local regulations in force. Failure to follow the above recommendations may result in misuse of the product and cause injury to persons and/or damage to property.

DRY INSTALLATION ON GRASS

To create a pathway with stepping stones, first of all, it is important to determine the number of steps necessary for the entire path, making sure that the tiles are positioned equidistantly. So as to obtain maximum stability, it is recommended to dig out about 5/8cm from the soil, and then place a fine layer of gravel. Compact the substrate and then position the tile. To allow the turf to grow well, it is advisable to leave a gap of at least 10cm between one tile and another.

SAFE AND STABLE

LONG-LASTING

EASY TO CLEAN

DRAINS

It Is Good Practice To Lay The Surface Of The Tiles In Line With The Turf: This Way There Is No Risk Of Damaging The Lawn Mowers

To determine the correct sizing and positioning of the flooring, place the tiles on the ground and carefully position them equidistant from each other. Mark the perimeter of the tile using a spade in the soil.

Remove the turf and dig out about 5cm of soil. Form a stable and uniform substrate using fine gravel (grain size 4/8mm).

Lay the tile, so as to have an approximately 0.5cm level difference, between the tile and the ground. To simplify tile installation it is possible to use suitable tile installation handles. Knock the tile along the edges with a rubber hammer until it is at the same level as the turf.

CAUTION

DRY INSTALLATION ON GRAVEL / SAND

For installation on sand it is good to remember to place a geotextile on the gravel, on which to spread out a layer (from 2 to 5cm thick) of dry sand with a grain size of 0/2mm. It is necessary to compact the sand with a vibro-compacting plate before proceeding with the installation of the tiles. For particular uses and for stressful loads, it is advisable to consult a technician in order to calculate precisely the thicknesses of the various layers of the substrate.

The application layers proposed are to be taken as an indication, and have the sole purpose of showing how to obtain a correct flooring. It is recommended to always refer to the specific norms and regulations in each individual country and the instructions of the project supervisor.

DRY INSTALLATION ON GRAVEL / SAND

In Order To Avoid The Displacement Of The Substrate And Consequently The Tiles, The Substrate Must Be Partitioned With Containment Edges Or Perimeter Curbs.

Form a stable and uniform substrate using fine gravel or sand. Level the substrate with a metal straight edge.

Position the tile and then compact the edges in order to level the tile with the substrate. It is suggested to use a joint of at least 4mm to allow good water drainage.

Spacers designed for laying tiles on sand or gravel are an extremely versatile and practical system despite their simplicity. The support is made up of a head with a spacer cross and a removable tip: the fins of the head cross help position the tiles and create the joint between them, ensuring that over time the flooring maintains its correct positioning. The tip is specific for application on sand: the elongated shape guarantees the anchorage and stability of the tiles, preventing them from slipping. For use on gravel, it is possible to remove the tip and place the spacer head directly on the gravel.

ELEVATED FLOOR INSTALLATION

The elevated floor technology offers many specific and immediately perceivable advantages: it allows the passage of cables, pipes and necessary installations to be managed easily; it enables the underfloor to be inspected easily and guarantees an effective draining of Rainwater. Thanks to the presence of independent elements, elevated floors absorb expansion and structural movements, thus avoiding the formation of cracks on the waterproof embrane. The absence of the screed makes it possible to substantially reduce the weight that burdens the structures, while offering a high resistance to loads.

For The Optimal Drainage Of Rainwater, The Elevated Flooring Must Be Installed With A Slope Of Between 1.5% And 2%.

The installation on the plastic supports must only been done on perfectly waterproof substrates. Before proceeding with the installation clean the substrate thoroughly.

With regard to the number and position of the supports, as well as the type of reinforcement on the back of the slab, it is recommended to follow the instructions given in the following table, which are essential to evenly distribute the load.

With the use of the special adjustment key it is possible to obtain a perfectly stable surface and with the required slope for better water drainage.
